1. Project brief

The Bureau of Energy Efficiency (BEE) is keen to implement innovative energy efficiency technologies and deploy large-scale implementation of energy efficiency measures in the PAT industries i.e., the designated consumers (**DCs**). Energy Efficiency Services Limited (EESL) has a vast experience in the implementation of large-scale energy-efficient projects through innovative financial models and demand aggregation. In this context, BEE has entrusted EESL with providing support to PAT industries for the demonstration of innovative energy-efficient technologies & creating an ecosystem to enable market transformation for such innovative technologies. BEE and EESL with their collaborative approach and expertise has prepared this program to implement innovative technologies and deploy a bespoke package of energy efficiency technologies in PAT industries.

The overall objective of this program is to demonstrate emerging/innovative energy-efficient technologies in the identified PAT sectors and to create a self-sustaining mechanism for their upscaling. Key activities of the project are as below

- Identification of Innovative technologies
- Selection of beneficiaries through REoIs (Request for expression of interest)
- Baseline study & DPR preparation
- Procurement, Installation & commissioning of technology
- Measurement & Verification (M&V)
- Training and capacity building

Emerging technologies, which are innovative in nature and have the potential to replicate in the notified PAT industries, which have not been commercialized to a large scale and have the potential for energy efficiency improvement or generation will be targeted under the scheme. JTWC has already identified four technologies for the demonstration of the project. The following are the next set of technologies approved.

1. High-Grade waste heat recovery system
 - a. Scrap preheating
 - b. Regenerative burners
 - c. Recuperator
2. Cooling Solutions from Low Waste Heat Recovery (VAM) system
3. Industrial Automation
 - a. Online Coal GCV Analyser
 - b. Automatic Blowdown Control System
 - c. Intelligent Flow Controller
4. IE4 Motors with VFD
5. Inlet air cooling system

Through this request for expression of interest, we are getting the willingness of beneficiary units and collecting the data to assess the suitability of the technology for a demo project. Beneficiary units will be selected through this EoI on the basis of the highest contribution in the terms of technology cost from the DCs as per DC selection criteria given in Section 3. Technology briefs for demo projects are given below.

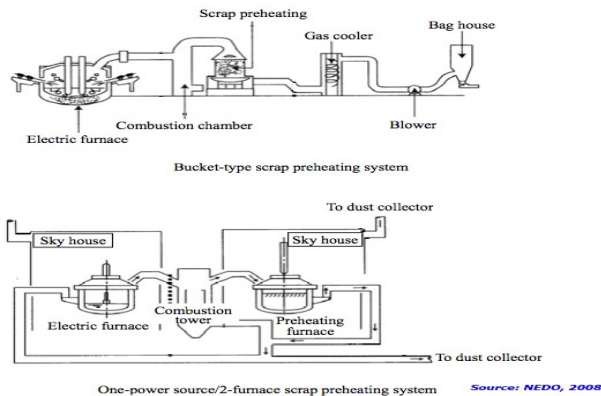

Finance for the project shall be done through the grant support (partially) by Bureau of Energy Efficiency (BEE) and an upfront contribution from DC. DCs has to contribute a minimum of 30% of the total technology cost. The DC, who will contribute more will be preferred for selection. Grant support by BEE shall not be recovered from DCs. A marking matrix will be prepared based on the upfront contribution of the DC towards the demonstration project as per clause 3.

2. Technology Information

Technical details of approved innovative energy-efficient technologies are given below:

2.1 High-grade Waste heat recovery

2.1.1 Scrap pre-heating

| | |
|---------------------------------|---|
| APPLICABILITY IN SECTORS | <ul style="list-style-type: none"> ● Aluminium ● Iron & Steel |
| SUITABILITY | Electric Arc Furnaces in Iron & Steel organizations & Exhaust waste gases from Aluminium melting furnaces can be used for preheating. |
| BRIEF DESCRIPTION | <p>Scrap preheating is a technology that can reduce the power consumption of an electric arc furnace (EAF) by using the waste heat of the furnace to preheat the scrap charge. Scrap preheating is performed either in the scrap charging baskets, in a charging shaft (shaft furnace) added to the EAF, or in a specially designed scrap conveying system allowing continuous charging during the melting process. Shaft furnace and tunnel furnace systems are modern and efficient preheating.</p> <p>Considering application in the Iron & Steel industry, the use of an EAF, already uses approximately 30 to 40 % less energy than the primary route (blast furnace, DRI kilns). Partial scrap preheating generally saves about 60 kWh/ton, while total scrap preheating saves up to 100 kWh/t of liquid steel (IPPC, 2001). Since lower electricity use leads to lower CO₂ emissions the technology supports environmental protection.</p>  <p>Considering application in the Aluminium industry, there is a significant amount of waste heat in the exhaust of an aluminium crucible that can be used for preheating the scrap to 480 to 530 °C and simultaneously preheats the combustion air to 425-480 °C taking into account system heat losses and air leakage. Following table shows the heat content w.r.t scrap temperature:</p> |

| | <p>Table XX: Scrap temperature vs heat content¹</p> <table> <tr> <th>Scrap temperature (°C)</th><th>Heat content (kWh/t)</th></tr> <tr> <td>150</td><td>22</td></tr> <tr> <td>260</td><td>40</td></tr> <tr> <td>370</td><td>57</td></tr> <tr> <td>540</td><td>81</td></tr> </table> | Scrap temperature (°C) | Heat content (kWh/t) | 150 | 22 | 260 | 40 | 370 | 57 | 540 | 81 |
|------------------------|--|------------------------|----------------------|-----|----|-----|----|-----|----|-----|----|
| Scrap temperature (°C) | Heat content (kWh/t) | | | | | | | | | | |
| 150 | 22 | | | | | | | | | | |
| 260 | 40 | | | | | | | | | | |
| 370 | 57 | | | | | | | | | | |
| 540 | 81 | | | | | | | | | | |
| BENEFITS | <ul style="list-style-type: none"> ● Removal of moisture from scrap ● Reduced refractory damage ● Improved thermal efficiency ● Energy and CO2 savings | | | | | | | | | | |

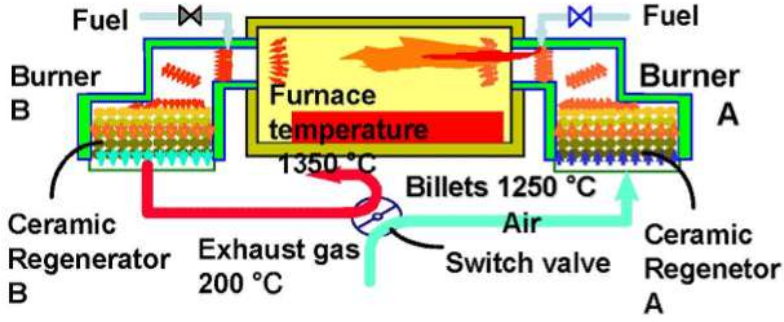

2.1.2 Regenerative burners

| | |
|---------------------------------|---|
| APPLICABILITY IN SECTORS | <ul style="list-style-type: none"> ● Iron & Steel ● Aluminium |
| SUITABILITY | <ul style="list-style-type: none"> ● Heat recovery of furnace exhaust gases and usage in preheating of combustion air |
| BRIEF DESCRIPTION | <p>The process of regeneration² uses a pair of burners that cycle to alternately heat the combustion air or recover and store the heat from the furnace exhaust gasses. When one regenerative burner is firing, the other is exhausting the furnace gasses. Exhaust gasses pass through the regenerative burner body and into a media case which contains refractory material. The refractory media is heated by the exhaust gasses, thus recovering, and storing energy from the flue products. When the media bed is fully heated, the regenerative burner currently firing is turned off and begins to exhaust the flue products.</p> <p>These regenerative burners fire alternately to recover the sensible heat from waste gas³ for the preheating of combustion air. The systems are capable of obtaining high-temperature preheated air exceeding 1,000°C in a short timeframe, by repeated heat accumulation and combustion. They recover between 85 -90 % of the heat from the furnace waste gases; therefore, the incoming combustion air can be preheated to very high temperatures of up to 10° -150 °C below the furnace operating temperature. Application temperatures range from 800oC up to 1500 °C. Fuel consumption can be reduced by up to 40 %.</p> |

¹ <https://p2infohouse.org/ref/10/09048.pdf>

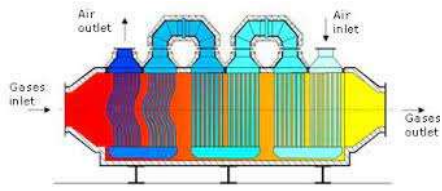

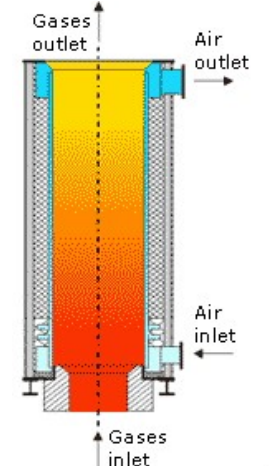

² https://www.bloomeng.com/burner_types/regenerative-burners

³ https://www.eng.nipponsteel.com/english/whatwedo/steelplants/rolling/regenerative_burner_type_reheating_furnace/

| | |
|-----------------|--|
| | <p style="text-align: center;">Regenerative Burners</p>  <p style="text-align: right;"><small>Source: APP, 2010</small></p> |
| BENEFITS | <ul style="list-style-type: none"> • Increased combustion efficiency • Low NO_x emissions • More than 15% energy reduction is possible. • Reduction in maintenance costs |

2.1.3 Recuperators

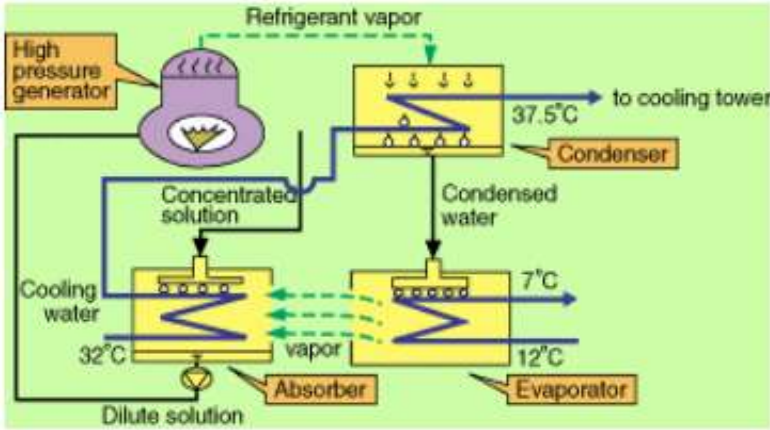

| | |
|---------------------------------|---|
| APPLICABILITY IN SECTORS | <ul style="list-style-type: none"> • Aluminium • Iron & Steel • Cement |
| SUITABILITY | <ul style="list-style-type: none"> • Steel reheat furnaces & heat treatment furnaces • Steel anneal and pickle lines • Steel galvanising lines • Direct reduced iron furnaces • Aluminium melting furnaces • Aluminium heat treatment furnaces • Ceramic and refractory kilns • Waste Incinerators • Any other application where exhaust gasses can be reused |
| BRIEF DESCRIPTION | <p>In a recuperator, heat exchange takes place between the flue gasses and the air through metallic or ceramic walls. Ducts or tubes carry the air for combustion to be preheated, the other side contains the waste heat stream. Recuperators are classified based on the principle of heat transfer by radiation, convection, or combinations. Recuperators are constructed out of either metallic or ceramic materials. Metallic recuperators are used in applications with temperatures below 1050 deg C, while heat recovery at higher temperatures is better suited to ceramic tube recuperators which can operate with hot side temperatures as high as 1500 deg C and cold side temperatures of around 950 deg C. For maximum effectiveness of heat transfer, hybrid recuperators are used. These are combinations of radiation and convective designs, with a high-temperature radiation section followed by a convective section.</p> |

| | |
|-----------------|---|
| |  <p style="text-align: center;">Convective Recuperator</p>  <p style="text-align: center;">Radiation Recuperator</p> |
| BENEFITS | <ul style="list-style-type: none"> • Higher Flame Temperature • Better Combustion Efficiency • Reduced fuel cost by using preheated air in burners • Higher Furnace Output • Lesser emissions |

3. Cooling solutions from Low Grade Waste heat recovery (VAM)

| | |
|---------------------------------|--|
| APPLICABILITY IN SECTORS | <ul style="list-style-type: none"> • Cement • Chlor-Alkali • Fertilizers • Iron & Steel • Pulp & Paper • Textile • Thermal Power Plants • Refineries • Petrochemicals |
| SUITABILITY | <ul style="list-style-type: none"> • For cooling processes |
| BRIEF DESCRIPTION | <p>A vapour absorption chiller (VAM⁴) is a machine to produce chilled water using heat sources such as steam, hot water, and gas. A fluid pair of lithium bromide and water are used in commercial VAM. The refrigerant used is actually water, as that is the working medium that experiences a phase change and causes the cooling effect. The second fluid that drives the process is salt, generally lithium bromide. Heat is used to separate the two fluids, when they are mixed in a near vacuum environment. For low-</p> |

⁴ <https://pdhonline.com/courses/m130/m130content.pdf>

| | |
|-----------------|--|
| | <p>temperature applications, ammonia-based absorption machines are used that utilize ammonia as a refrigerant and water as an absorbent. These machines use only a small fraction of electricity as compared to the conventional vapour compression chillers. Vapour absorption systems work with non-CFC environmentally friendly refrigerants such as water or ammonia.</p>  <p>Various parts and working of VAM</p> |
| BENEFITS | <ul style="list-style-type: none"> • Can be nearly (not entirely) powered by Waste Heat • No/less electricity consumption • No Noise/vibration due to the absence of compressors • Natural refrigerants which have zero ODP and GWP |

4. Industrial automation

4.1 Online Coal GCV analysers

| | |
|---------------------------------|---|
| APPLICABILITY IN SECTORS | <ul style="list-style-type: none"> • Thermal Power • Iron and Steel • Pulp and Paper • Cement |
| SUITABILITY | Traditionally, Coal GCV measurement is done using Laboratory tests. |
| BRIEF DESCRIPTION | <p>Traditionally, Coal GCV measurement is done using a Laboratory test. Laboratory analysis only provides either a “snapshot” or an “average” of coal quality, it does not show the actual variations and by the time the laboratory results are available, thousands of tons of material have already been conveyed.</p> <p>The online Coal GCV Analyser provides real-time data that can then immediately drive decisions at the power plant. This analysis method uses a radioisotope that has a low energy level, can be used for a long time without requiring replacement, has low radiation and is safe and reliable.</p> <p>This analyser finds extensive use in Coal Mining, Coal Washeries, Coal Blending Plants, Coal-fired Power Plants, Coking Plants, steel plants, etc. It is especially</p> |

suitable for online coal ash analysis on the entire belt conveyor during the coal transportation process.

Installation of the machine has given the advantage of feeding close-to-design GCV coal in the Boiler for optimizing combustion. Unscheduled loss of generation on account of coal quality can be avoided. Additionally, it also provides online information on the Slagging index of the coal, so that Boiler slagging & hence long outages can be prevented.

BENEFITS

- Helps in real-time analysis of coal GCV
- Helps in feeding close-to-design GCV coal to boiler
- Helps in optimised combustion of coal
- Reduction in loss of generation due to poor coal quality

4.2 Automatic blowdown control system

| | |
|---------------------------------|--|
| APPLICABILITY IN SECTORS | <ul style="list-style-type: none"> This can be used across sectors where boilers with manual blowdown is used (Thermal power plant, Pulp and Paper, Textile) |
| SUITABILITY | Manual blowdown system |
| BRIEF DESCRIPTION | <p>Boilers generate steam used for heating or manufacturing processes. When steam leaves the boiler, impurities (TDS – total dissolved solids) are left behind to accumulate in the boiler. Accumulation of TDS beyond their solubility limit results in the formation of scale.</p> <p>Blowdown is the process of removing water with high concentrations of TDS and replacing it with fresh makeup water with lower levels of TDS, thereby lowering the overall TDS in the boiler.</p> <p>Two types of blowdown: Bottom blowdown – which removes sediment/sludge from the bottom of the boiler; Surface skimmer blowdown – which removes high-TDS water near the surface (6" below the water line). Automated controllers only regulate surface blowdown.</p> <ol style="list-style-type: none"> 1. TDS can be directly measured by lab tests (costly, time-consuming) or can be approximated by conductivity measurements (inexpensive, quick, reasonably accurate). 2. Two types of surface blowdown: manual and automated <p>Manual Blowdown</p> <ol style="list-style-type: none"> 1. Involves manually opening a blowdown valve at various times throughout the day; used in conjunction with a hand-held conductivity meter to keep some degree of control over TDS levels. 2. Results in high and low conductivity spikes due to boiler load variances. 3. Conductivity levels above the target maximum lead to the formation of scale. Conductivity levels below the target maximum result in excess water and chemical usage. 4. At best, manual systems err on the safe side and keep TDS too low. <p>Automated Blowdown</p> <ol style="list-style-type: none"> 1. Uses an automated controller and valves to continuously or intermittently sample the boiler water and then blow down as needed. 2. Types of Automated Blowdown <ol style="list-style-type: none"> a. Continuous Sampling – Used when steam blowdown requirements exceed 2000 kg/hr. A sample of water is continuously sent across the conductivity probe to drain. When conductivity levels exceed the target maximum, a larger blowdown valve opens and sends more water to drain until the set point is satisfied. b. Timed Sampling (most common) – Used when steam blowdown requirements are less than 2000 kg/hr. A sample of water is intermittently sent across the probe for a predetermined amount of time (interval and duration are adjustable), and the blowdown valve is held open until the conductivity set point is satisfied. |

| | |
|-----------------|--|
| | Boilers without a blowdown heat recovery system and with high blowdown rates offer the greatest energy-savings potential. The optimum blowdown rate is determined by a number of factors, including boiler type, operating pressure, water treatment, and makeup-water quality. Savings also depend upon the quantity of condensate returned to the boiler. |
| BENEFITS | <ul style="list-style-type: none"> • With automatic blowdown, one can avoid high and low conductivity spikes due to boiler load variance. • Can avoid keeping the TDS too low than what is required • Reduced operating costs (less feed water consumption, chemical treatment and higher heating efficiency) • Reduced maintenance and repair costs (minimised carryover and deposits) • Cleaner and more efficient steam • Minimise energy loss from boiler blowdown |

4.3 Intelligent Flow Controller (IFC) for Compressed Air Network

| | |
|---------------------------------|---|
| APPLICABILITY IN SECTORS | <ul style="list-style-type: none"> • Cement • Textile • Chemical • Pulp and Paper <p>This can be used across sectors where compressed air system is used</p> |
| SUITABILITY | It can be used where the compressed air demand is met from manual control system |
| BRIEF DESCRIPTION | The fluctuating air pressure is the major problem faced by industries caused due to intermittent use of several pneumatic types of equipment. It begins with the sudden air demand pulling down the pressure at the point of use. The air compressors get to know about it when this air demand travels to the upstream generation side through the distribution network. The control mechanism of the air compressor then starts delivering compressed air in the form of load/unload or VSD. Practically it takes a while for the entire air system to fill up to the required pressure. Thus the compressor operators maintain a higher level of pressure in the air system to minimise the lag in the response time between demand and supply to sustain a sudden demand. Thus more compressors are needed to meet this artificial demand causing waste of compressed air and leading to an energy inefficient system translating into high-energy bills. |

Figure: IFC model

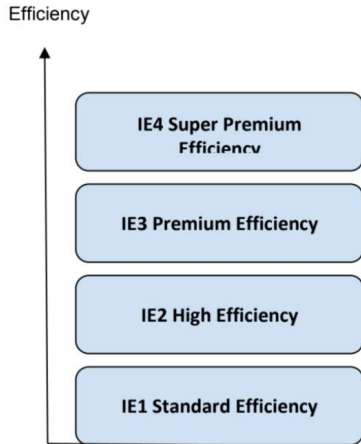

Intelligent Flow Controller (IFC) controls the airflow and pressure being delivered to the plant. It operates at the intermediate point of the compressed air system, i.e. on downstream of Dryers/Receivers and upstream of the main piping distribution system.

IFC creates useful storage, which isolates compressors from the demand side peak and trough to provide a stable air supply at optimum pressure. It monitors the demand side rate of change of pressure and releases only the required amount of storage air to satisfy the peak demand instead of starting additional compressors. Thus reduction in the mass of air and a reduction in the load period of compressors leads to energy savings.

BENEFITS

- Energy saving from 7% to 20%
- Simple payback period within 1 to 2 years
- Creates useful storage in the compressed air system
- Increases the response time of the system to meet instantaneous demand
- Constant air pressure to pneumatic tools; Reduction in artificial demand
- Reduction in compressed air leaks
- Reduction in compressor's operation & maintenance cost.

5. IE4 motors with VFD application

| | |
|---------------------------------|---|
| APPLICABILITY IN SECTORS | <ul style="list-style-type: none"> All sectors of PAT |
| SUITABILITY | <ul style="list-style-type: none"> Pumps, Fans, blowers, compressors etc., are driven by less efficient (IE1 & IE2) motors |
| BRIEF DESCRIPTION | <p>The international IEC standard for electric motors (IEC 60034-30-1) classification scheme identifies four levels of motor efficiency;</p> <ul style="list-style-type: none"> IE1 - Standard efficiency IE2 - High efficiency IE3 - Premium efficiency IE4 - Super premium efficiency <p>Indian industries historically have used IE1 motors or non-standardised motors since last many years, and also follows the practice of rewinding of motors many times after failure, but these practices not only increase energy consumption but also increases specific energy consumption. Energy-efficient motors use less electricity, run cooler and provide more mechanical output by consuming less electrical input energy. In the efficiency category of electric motors, IE1 is considered a standard motor. Motors are rated IE1 to IE4 in increasing efficiency as shown in Figure 1.</p>  <p>Figure 1: Motor Efficiency Classification</p> <p>Figure 1: Motor Efficiency Classification</p> <p>In India, IE2 has been set as the Minimum energy performance standard for motors. Innovation and technology advancements have helped to reduce motor losses and improve motor efficiency. Figure 2 represents an energy efficiency comparison of IE1, IE2, IE3 and IE4 motors (4 poles 50 HZ) at various motor ratings (KW).</p> |

Figure 2: Efficiency curves for IE4, IE3, IE2 and IE1 4 pole 50Hz electric motors

Energy efficient motor pays for itself because, over the life of the motor, the major cost is the running cost of the motor, having a contribution of 97% in the lifetime cost of the motor. Purchase cost contributes to 2% and repair and maintenance cost to 1%. Though the motor can be repaired 2-3 times over its lifetime, if it is done unprofessionally, it results in losses and a reduction in energy efficiency. With a service life of 10-15 years, the payback time for an IE4 motor compared to an IE3 is in many cases less than 2-3 years depending on motor size and operating hours. e.g. a 55kW, 4 poles motor operating 4000 hours a year will have a payback time of 2.5 years.

The super-premium efficiency (IE4) motors come in the size range of 0.37 kW to 375 kW. The load factor of the IE4 motor should be greater than 65% so that the advantage of energy savings can be achieved. The benefits of using IE4 motors are maximum in continuous-duty applications such as compressors, pumps, fans, blowers, etc.

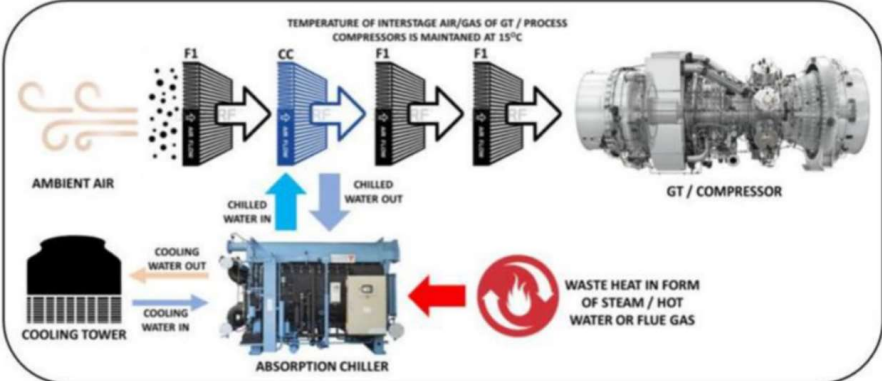

IE4 motors are also equipped for frequency converter (VFD) duty. By using IE4 motors together with a premium VFD there can be several benefits including better process control, energy savings and a reduced starting current. It can further reduce stress on mechanical equipment and the electrical supply network.

The internal efficiency loss caused by heat generation and friction can be as high as 20% in small motors and 4-5% in motors upward of 160 kW. IE4 motors operate with significantly less heating and, as a result, with much lower losses. Lower working temperatures mean less thermal stress on the motor, the motor bearings and the terminals. Motor service life is significantly extended as a result.

BENEFITS

- High efficiency & Less maintenance
- Lower operating temperatures
- Less thermal stress on the motor, the motor bearings and terminals.
- Enhanced motor life & Low operating cost

6. Inlet air cooling system

| | |
|---------------------------------|---|
| APPLICABILITY IN SECTORS | <ul style="list-style-type: none"> In all sectors where Gas Turbines and bigger capacity air compressors are installed |
| SUITABILITY | <ul style="list-style-type: none"> For inlet air cooling |
| BRIEF DESCRIPTION | <p>Gas turbines and bigger size process air compressors take in filtered ambient air and compress it in the compressor stage. The performance of a gas turbine, its efficiency (heat rate) and generated power output strongly depend on the climate conditions, which may decrease the output power ratings by around 20-25%. In a Gas turbine, after mixing with the fuel in the combustion chamber, compressed air is ignited, leading to a high temperature and high-pressure flow of exhaust gases entering the turbine. As the gas turbine is a constant-volume machine, air volume introduced in the combustion chamber after the compression stage is fixed for a given shaft speed (rpm). Thus the air mass flow is directly related to the density of air, and the introduced volume. $m = \rho V$ Where m is the mass, ρ is the density and V is the volume of the gas. As volume V is fixed, only density ρ of the air can be modified to vary air mass. The density of the air depends on the relative humidity, altitude and temperature. To operate the turbine at ISO conditions and recover performance, inlet air cooling systems are the best.</p>  <p style="text-align: center;">Figure XX: Inlet air cooling</p> |
| BENEFITS | <ul style="list-style-type: none"> Heat rate can be improved by 6-8% as per the performance curve of the turbine With inlet air cooling the air temperature can be maintained at 15 Deg C and as a result the throughput of the turbine/compressor can achieve ISO condition Reduction in repair and maintenance cost |

7. Designated Consumer Selection Criteria

| S. No. | Criteria | Sub Criteria | Qualifying Criteria | Weightage for selection |
|--|---------------------------------------|---|--|-------------------------|
| 1. | Percentage Upfront contribution by DC | % of the estimated project cost | Min. 50% | 50% |
| 2. | Overall contribution | Total contribution (INR) | INR | 50% |
| If the sum of score of 1 and 2 is same, following marking will be adopted for the selection of beneficiary units. | | | | |
| 2 | Specific energy saving | Cost basis (toe/Lakh Rs.) | Energy saved per INR lakh of investment | 50% |
| 3 | Specific emission saving | Cost basis (tCO ₂ /Lakh Rs.) | GHG mitigated per INR lakh of investment | 50% |

***Estimated project cost includes the cost of equipment and associated accessories, freight, insurance, unloading, installation and commissioning, etc.**

- A maximum number of technologies that shall be demonstrated in a single DC/group of DC be limited to maximum 2 technologies and project investment cost not more than INR 200 Lakhs in one single DC/group of DC.
- **The beneficiary industry will be selected through competitive bidding for whoever gets the highest marks in the evaluation of Expression of Interest.**

8. Objective of the REOI

Objective of REOI is to adopt a transparent mechanism for the selection of beneficiary units for demonstration. As government organizations, BEE and EESL follow norms of transparency in all their engagements.

For the finalization of REOs EESL will adopt a cafeteria approach to assess the willingness of DCs toward the implementation of these energy-saving technologies. REOs will also include the information to assess the capacity, saving potential, investment and payback period, organization/sectoral representation etc.

Annexures are attached for technical information to evaluate the above parameters.

9. Evaluation of the REOI

Units will be selected in a transparent manner by a committee comprising members from BEE & EESL. Evaluation of REOs will be carried out in 2 stages as detailed below.

Stage-1

Information will be collected from the designated consumers through an online webpage. PMU will compile and analyze the information to evaluate the techno-commercial feasibility of the demonstration. The findings of the feasibility report will be shared with DCs to receive 2nd stage offers.

Stage-2

Cost Contribution has to be declared by each DCs based on the techno-commercial feasibility report

shared. DC will be mapped in the DC selection matrix and ranking will be assessed. The selection matrix will be put up to the JTWC for approval.

If multiple units have the same ranking for the beneficiary selection for a particular technology, priority may be accorded as mentioned above in section 3.

10. Commercial Terms

9.1 Contribution of the technology cost sharing

The contribution of the technology cost sharing by DCs (To be filled during the second stage REoI after sharing the techno commercial feasibility report) in

- a. INR _____ (in figures)
- b. INR _____ (in words)
- c. In percentage(_____%) of estimated technology cost

9.2 Payment milestones towards upfront contribution

Payment milestones for cost-shared by DCs as agreed in clause 6.1

- a. DC has to submit an Advance Bank Guarantee (ABG) equivalent to 10% of estimated technology cost at the time of signing of the agreement. ABG should be valid for the duration till 100% receipt of DC's cost contribution.
- b. 50% of DC's contribution within 10 days from the date of the delivery of equipment at site
- c. Balance 50% of DC's contribution within 10 days from the date of successful commissioning of equipment
- d. ABG will be returned on receipt of 100% amount of DC's cost contribution
- e. All statutory taxes/duties including GST or any indirect taxes or any duties / levies / CESS (including but not limited to labor CESS, construction CESS, and workmen compensation CESS) as applicable shall be reimbursed by DC to EESL on an actual basis.
- f. In case of delay in payment to EESL, a "Delayed Payment Surcharge" shall be applicable on the outstanding amount due to EESL for the period beyond the "Due Date" to the actual date of credit of such dues into the EESL bank account. The Delayed Payment Surcharge shall be applicable at the rate of 2% over and above the annual SBI MCLR rate on the outstanding amount due to EESL on a day-to-day basis (and compounded monthly) for the duration starting from the Due Date to the actual date of receipt of payment against EESL's invoices.

9.3 In Case of Non-submission of the document by DC

If the selected DC is not able to submit documents along with ABG at the time of signing of the agreement, an offer will be given to the next shortlisted DC. The contribution amount from DC shall be based on the actual discovered price of the technology through competitive bidding.

9.4 Exclusion

Minor works not related to energy saving and necessary for the implementation of the Energy Efficiency technology will be under the scope of DC (like civil works, integration with the existing system, electrical lining/cabling, earthing, etc.)

11. REol Format

Interested DC(s) have to download the excel file from the EESL website (Corporate Driven – Energy Efficiency Services Limited (eeslindia.org) and fill out the Microsoft form for the interesting technologies available at the following link.

ABOUT THE PROJECT

EESL and EESL are jointly planning to support Streetlighting Conversion (SLC) projects by providing technical assistance and financial support to the states. The project is aimed at converting the existing streetlights to LED lights, which will help in reducing the energy consumption and improving the street lighting quality.

EESL (EESL) has to develop a list of technologies in the SLC project and the list will be shared with the states for their selection. Subsequently, EESL will implement the SLC project in the states and will provide the necessary support to the states for the implementation of the project.

12. Designated Consumer Selection Criteria

| S. No. | Criteria | Sub Criteria | Qualifying Criteria | Weightage for selection |
|--|---------------------------------------|---|--|-------------------------|
| 1. | Percentage Upfront contribution by DC | % of the estimated project cost* | Min. 30% of project cost | 50% |
| 2. | Overall contribution | Total contribution (INR) | INR | 50% |
| If the sum of score of 1 and 2 is same, following marking will be adopted for the selection of beneficiary units. | | | | |
| 3 | Specific energy saving | Cost basis (toe/Lakh Rs.) | Energy saved per INR lakh of investment | 50% |
| 4 | Specific emission saving | Cost basis (tCO ₂ /Lakh Rs.) | GHG mitigated per INR lakh of investment | 50% |

*Estimated project cost includes the cost of equipment and associated accessories, freight, and insurance, unloading, installation and commissioning, etc.

- A maximum number of technologies that shall be demonstrated in a single DC/group of DC be limited to maximum 2 technologies and project investment cost not more than INR 200 Lakhs in one single DC/group of DC under DEEP scheme.
- **The beneficiary industry will be selected through competitive bidding for whoever gets the highest marks in the evaluation of Expression of Interest.**

13. Important dates

| Sr. No. | Activity | Duration |
|---------|---|--|
| A | Downloading of EOI formats will be available | 20 th Jan 2023 |
| B | Submission of EOI | Till 31 st Jan 2023 |
| C | 2 nd stage REOI Release for cost contribution (Through emails to the short listed DCs) | To be informed via mail to applicant DC (for any queries & concerns, please mail at deep@eesl.co.in) |
| D | Window for submission of 2 nd stage REOI | To be informed |
| E | Approval from JTWC committee | To be informed |
| F | Signing of agreement with selected DCs | To be informed |

14. Technical Parameters

| Sr. No. | Parameters | UoM | Input |
|---------|----------------------------|-----|-------|
| | Client Information | | |
| 1 | Name of the Company | | |
| 2 | Company Group | | |
| 3 | Company Website | | |
| 4 | Sector of Industry | | |
| 5 | PAT Registration Number | | |
| 6 | Address | | |
| 7 | City | | |
| 8 | State | | |
| 9 | PIN | | |
| 10 | Name of the Contact Person | | |
| 11 | Designation | | |
| 12 | Contact No. (Mobile) | | |
| 13 | Contact No. (Office) | | |

| | | | |
|----|--------------------------------------|----------|--|
| 14 | Email Address | | |
| 15 | Plant operation cycle | | |
| 16 | The average cost of electric Power | Rs./unit | |
| 17 | Plant Power Demand Maximum / Average | MW | |
| 18 | Site ambient air temperature | °C | |
| 19 | Site Relative humidity (Rh) | % | |
| 20 | Site altitude | MSL | |

14.1 High-Grade Waste Heat Recovery System - Scrap pre heating

| S. No | Parameters | UoM | Furnace-1 |
|-------|---|------------------------|-----------|
| 1 | Gas flow at furnace outlet | | |
| 1.a | Max. gas flow at furnace outlet | Nm3/h | |
| 1.b | Avg. gas flow at furnace outlet | Nm3/h | |
| 1.c | Min. gas flow at furnace outlet | Nm3/h | |
| 2 | Gas temp. at furnace outlet | | |
| 2.a | Max. gas temp. at furnace outlet | °C | |
| 2.b | Avg. gas temp. at furnace outlet | °C | |
| 2.c | Min. gas temp. at furnace outlet | °C | |
| 1 | Electric Arc Furnace and transformer details (specifications) | | |
| 2 | % Carbon in liquid metal | % | |
| 3 | Tapping (liquid metal temp.) | °C | |
| 4 | Tapping (Batch) weight of EAF | Ton | |
| 5 | Hot Heel (molten steel plus slag) of EAF | Ton | |
| 6 | Fuel used in furnace | | |
| 7 | The sulfur dew point of fuel | °C | |
| 8 | Ambient temperature | °C | |
| 9 | Weight of scrap (for preheating) | Kg/h | |
| 10 | Type and size of scrap material | | |
| 11 | Density of scrap material | ton / cum | |
| 12 | Specific heat of scrap material | kCal/(kg-°C) | |
| 13 | The temperature of scrap before preheating | °C | |
| 14 | Quantity of fuel used | l/h (or) kg/h (or) kWh | |
| 15 | NCV of fuel | kCal/kg | |
| 16 | Fuel Cost | Rs. /kg | |
| 17 | Daily operating hours | h/d | |
| 18 | Annual operating days | d/y | |
| 19 | Additional comment If any | | |
| 20 | Willing to contribute to Project Cost (min 30%) | Yes/No | |

14.2 High-Grade Waste Heat Recovery System _ Regenerative Burners

GENERAL QUESTIONS

| S. No | Parameters | UoM | Input |
|-------|---|-----|-------|
| 1 | Brief description of the technological process where the recuperator will be used. | | |
| 2 | Place of installation of the recuperator (description, layout with dimensions, photos). | | |
| 3 | Sizes of flanges or other connecting elements of inlet and outlet tubes. | | |

| | | | |
|----|--|-----|--|
| 4 | Are there any restrictions on dimensions? (width, depth, height). | M | |
| 5 | Recuperator operating mode | h/d | |
| 6 | Recuperator operating mode | d/y | |
| 7 | Desired direction of movement of the medium (counter, cross, parallel). | | |
| 8 | Is there an existing heat exchanger or was there a heat exchanger installed previously? If yes, what are its present characteristics (dimensions, weight, advantages/disadvantages, technical characteristics). | | |
| 9 | Where the heating medium will be taken from | | |
| 10 | The purpose of the heated medium? Where will it be used? | | |
| 11 | Required quantity of recuperators? | | |

OPERATIONAL PARAMETERS

| S. No | Name | UoM | Heating medium (heat transferred from) | Heated medium (heat transferred to) | Heating medium (heat transferred from) | Heated medium (heat transferred to) |
|-------|---|--------------------------------------|--|-------------------------------------|--|-------------------------------------|
| 11 | Medium (air, gas, others) | | | | | |
| 12 | Inlet Temperature | °C | | | | |
| 13 | Outlet Temperature | °C | | | | |
| 14 | Mass flow rate | kg/hr | | | | |
| 15 | Inlet pressure | kg/cm ² | | | | |
| 16 | Pressure drop | kg/cm ² | | | | |
| 17 | Presence of SO ₂ & % | YES/NO/No data | | | | |
| 18 | Presence of SO ₃ & % | YES/NO/No data | | | | |
| 18 | Dustiness of inlet flow | g/nm ³ (yes, no, no data) | | | | |
| 19 | Additional comment, If any | | | | | |
| 20 | Willing to contribute to Project Cost (min 30%) | | | | | |

14.3 Cooling solutions from Low Grade Waste heat recovery (Vapor absorption chiller/ VAM)

| S. No | Parameters | UoM | heat source-1 |
|-------|--|------|---------------|
| 1 | Source and type of waste heat available | | |
| 2 | Waste heat available (flow rate) | | |
| 2.a | Maximum | Kg/h | |
| 2.b | Average | Kg/h | |
| 2.c | Minimum | Kg/h | |
| 3 | temperature of waste heat available | | |
| 3.a | Maximum | °C | |
| 3.b | Average | °C | |

| S. No | Parameters | UoM | heat source-1 |
|-------|--|------------------------|---------------|
| 3.c | Minimum | °C | |
| 4 | Pressure of Waste heat | kg/cm ² | |
| 5 | Ambient temperature | °C | |
| 6 | Sulfur dew point temperature of the fuel | °C | |
| 7 | Type of fuel used in the device from which waste heat is being generated | | |
| 8 | Quantity of fuel used (flow rate) | Kg/hr | |
| 9 | Required Chilled water temperature at the inlet of VAM | °C | |
| 10 | Required Chilled water temperature at the outlet of VAM | °C | |
| 11 | Required Chilled water flow | m ³ /h | |
| 12 | Existing source of chilling | VAM/Electrical chiller | |
| 13 | Existing chilling capacity | TR | |
| 14 | Daily operating hours | h/d | |
| 15 | Annual operating days | d/y | |
| 16 | Specific Power consumption of existing chilling system (Including auxiliary) | Kw/TR | |
| 17 | Power cost | INR/KWH | |
| 18 | Capacity of existing Cooling tower | TR | |
| 19 | existing flow of cooling tower pumps | M ³ /HR | |
| 20 | No. of cooling tower pumps | nos | |
| 21 | Temperature profile of cooling tower approach | °C | |
| 22 | Temperature profile of cooling tower range | °C | |
| 23 | Condenser cooling type | Air / Water | |
| 24 | Additional comment If any | | |
| 24 | Willing to contribute to Project Cost (min 30%) | Yes/No | |

14.4 Industrial Automation: Online Coal GCV Analyser

| S.No. | TECHNICAL PARAMETERS | UoM | Input |
|----------|--|---|-------|
| 1 | Belt conveyor parameter: | | |
| | Belt material | | |
| | Belt width | mm | |
| | Belt Speed (Constant or Variable) | | |
| | Max Belt speed | m/s | |
| | Min Belt speed | m/s | |
| | Avg Belt speed | m/s | |
| | Thickness | mm | |
| | Belt height from the ground | inches | |
| 2 | Belt conveyor other conditions: | | |
| | Sway (Degree of Running) | YES/NO | |
| | Vibration | YES/NO | |
| 3 | Belt conveyor type (Ordinary leather belt / Steel wired belt / Chlorinated belts/ Others) | | |
| 4 | If it is steel wired belt conveyor: | | |
| | Thickness of steel wire belt inner steel wire | mm | |
| | Built-in space separation distance | mm | |
| 5 | Measured coal type: | *Mention Grade and moisture/ash content of coal | |
| | | | |
| | | | |

| S.No. | TECHNICAL PARAMETERS | UoM | Input |
|-------|--|-----------------------|-------|
| | | | |
| 6 | Measured coal bed: | | |
| | Max thickness | mm | |
| | Min thickness | mm | |
| 7 | Measured coal bed change condition: | HIGH | |
| | | LOW | |
| | | ADDITIONAL DETAILS | |
| 8 | The condition of coal when measured normally (Note: Data to be collected for different types of coal used separately, atleast 5 types of most commonly used coal) | | |
| | Ash range | % | |
| | Moisture content range | % | |
| | Calorific value | kCal/kg | |
| | General particle size range | µm | |
| | Presence of stones etc | - | |
| | Uniformity in coal size | - | |
| 9 | External conditions: | | |
| | Temperature range | °C | |
| | Humidity range | % | |
| | Whether it has rats (to provide braided cables etc.) | - | |
| | Whether it is prone to lightning strikes | - | |
| 10 | Distance of control room from sensor: | m | |
| 11 | Coal Size: - | | |
| | Maximum | mm | |
| | Average | mm | |
| | Minimum | mm | |
| 12 | Pictures for the belt, controlling room and surrounding areas etc: | | |
| 13 | If any other input: | | |

14.5 Industrial Automation: Automatic Blowdown-Control System

| S.No. | TECHNICAL PARAMETERS | UoM | Input |
|-------|---|---------|-------|
| | Design Parameters | | |
| 1 | *Boiler operating pressure | kg/cm2 | |
| 2 | Boiler capacity | TPH | |
| 3 | Boiler Efficiency | % | |
| 4 | Calorific Value of the Fuel | kcal/kg | |
| 5 | Cost of Fuel | INR/kg | |
| 6 | *Steam generation rate | kg/h | |
| 7 | *Feed water TDS | ppm | |
| 8 | *Feed water conductivity | µS/cm | |
| 9 | *Permissible boiler water TDS | ppm | |
| 10 | *Boiler water conductivity | µS/cm | |
| 11 | *Provision available for fitting conduction probe | - | |
| 12 | *If yes, Dimension of provision | | |
| 13 | *Blowdown control valve solenoid supply voltage | V | |

| S.No. | TECHNICAL PARAMETERS | UoM | Input |
|-------|-------------------------|-------|-------|
| 14 | Existing blow down rate | kg/hr | |
| 15 | Annual working days | d | |
| 16 | Daily working hours | h | |

14.6 Industrial Automation: IFC for Compressed Air Network

| S.No. | TECHNICAL PARAMETERS | UoM | Compressor 1 | Compressor 2 | Compressor 3 |
|-------|--|----------|--------------|--------------|--------------|
| | Compressor Data: | | | | |
| 1 | Make | | | | |
| 2 | Model | | | | |
| 3 | Compressor Type | | | | |
| 4 | Lub/Non-Lub | | | | |
| 5 | Control type | | | | |
| 6 | Control settings | Bar | | | |
| 7 | Capacity | CFM | | | |
| 8 | Motor | kW | | | |
| 9 | Rated Efficiency | % | | | |
| 10 | Voltage | V | | | |
| 11 | Starter type | | | | |
| 13 | Power consumption at Loaded Condition | kW | | | |
| 14 | Power consumption at Unloaded Condition | kW | | | |
| 15 | Is your compressed air system Centralised or Decentralised | | | | |
| | Operational data | | | | |
| 1 | Working compressors | | | | |
| 2 | Capacity | CFM | | | |
| 3 | Hours | | | | |
| 4 | Product manufactured | | | | |
| 5 | Use of compressed Air | | | | |
| 6 | System Unload Pr. : | Bar | | | |
| 7 | load Pr. : | Bar | | | |
| 8 | Accept Pr. : | Bar | | | |
| 9 | Working Hours / Day: | Hrs | | | |
| 10 | Days/Yr | days | | | |
| 11 | Electricity tariff rate: | Rs/kWh | | | |
| 12 | Daily Energy Consumption: | kWh/Day | | | |
| 13 | Main Header Size : | Inch/mm | | | |
| 14 | Comp Room Receiver: | m3 | | | |
| 15 | Dryer Present: | Yes / No | | | |
| 16 | Header Length in compressor room | Mtrs | | | |
| 17 | Receiver Sizing in Plant: | m3 | | | |
| 18 | Dew Point | °C | | | |
| 19 | Dryer Dp: | bar | | | |
| | Dryer | | | | |
| 1 | Make | | | | |
| 2 | Model | | | | |
| 3 | type | | | | |
| 4 | Capacity | CFM | | | |
| | Pre filters 1 | | | | |
| 1 | Make | | | | |

| S.No. | TECHNICAL PARAMETERS | UoM | Compressor 1 | Compressor 2 | Compressor 3 |
|-------------|---|-------|--------------|--------------|--------------|
| 2 | Model | | | | |
| 3 | Type | | | | |
| | Volumetric Flow Rate | m3/hr | | | |
| | Pre filters 2 (if applicable) | | | | |
| 1 | Make | | | | |
| 2 | Model | | | | |
| 3 | Type | | | | |
| | Volumetric Flow Rate | m3/hr | | | |
| | Pre filters 3 (if applicable) | | | | |
| 1 | Make | | | | |
| 2 | Model | | | | |
| 3 | Type | | | | |
| | Volumetric Flow Rate | m3/hr | | | |

| 4 | Volumetric Flow Rate | m3/hr | | | |
| | Please add any other post-filter data if applicable. | | | | |
| | Challenge in Existing Compressed Air System | | | | |
| | Operational data | | | | |
| 1 | Running Hours | | | | |
| 2 | Loaded Hours | | | | |
| 3 | Compressor no. | | | | |
| 4 | Please send a single line schematic diagram of your Compressed Air system along with this data sheet. | | | | |
| Note | Data to be collected for 24 Hours | | | | |

14.7 IE4 MOTORS WITH VFD

| S. No. | Preliminary motor data | Unit of Measure | Existing motor Specifications |
|--------|---|-----------------|-------------------------------|
| 1 | Application of motor | | |
| 2 | Motor power rating (0.75 to 75 KW) | KW | |
| 3 | Motor speed | rpm | |
| 4 | Frequency (50 Hz) | Hz | |
| 5 | Voltage (3 Phase LT Motors only) | V | |
| 6 | Motor mounting type | | |
| 7 | Type (Non Flame proof application only) | | |

| S. No. | Preliminary motor data | Unit of Measure | Existing motor Specifications |
|---|--------------------------|-----------------|-------------------------------|
| 8 | Motor efficiency | % | |
| 9 | Power factor | | |
| 10 | Ambient temperature | Deg C | |
| 11 | Class of insulation | | |
| 12 | Temperature rise limited | Deg C | |
| 13 | Type of cooling | | |
| 14 | Duty (S1) | | |
| 15 | Service factor | | |
| 16 | Ingress protection | | |
| 17 | Manufacturer | | |
| 18 | Starting method | | |
| 19 | No of poles | | |
| 20 | Nos of Rewindings done | | |
| 21 | Daily Operating Hours | Hrs | |
| 22 | Annual operating Days | No of Days | |
| 23 | Tariff | INR/kWHR | |
| Note: only Non flame proof 3 phase LT motors can be applied in range of 0.75 to 75Kw | | | |

14.8 Inlet Air Cooling

| S.No | Operating conditions / Technical Parameters | UoM | Design Parameter | Remarks |
|-------------|---|--------------|------------------|---------|
| Note | Please optimise the format for GT/Compressor as applicable. | | | |
| | ISO Standard for Machine | | | |
| A | PROSPECTIVE APPLICATIONS | | | |
| 1 | GT/Compressor Design Air flow | Kg/hr | 190000 | |
| 2 | Design inlet air temperature to Filter House | Deg C | 30 | |
| 3 | Design inlet air humidity to Filter House | % | 60 | |
| 4 | Design outlet air temperature from Filter House | Deg C | | |
| 5 | Design outlet air humidity from Filter House | % | | |
| 6 | Heat Load rejection | TR | To be Calculated | |
| B | HEAT SOURCE | | | |
| | Exhaust Gas | | | |
| 1 | GT exhaust flue gas temperature | deg. C | 200 | |
| 2 | GT exhaust flue gas flow | Kg/hr | 200000 | |
| | Process Condensate / Hot Water | | | |
| 1 | Hot water temperature | deg. C | | |
| 2 | Hot water flow rate | m3/hr | | |
| 3 | Pressure of hot water | bar(g) | | |
| 4 | Possible heat recovery | TR | To be Calculated | |
| | Steam | | | |
| 1 | Steam pressure | bar(g) | | |
| 2 | Steam temperature | deg. C | | |
| 3 | Approx steam available | kg/hr | | |
| C | Other operating parameters | | | |
| 1 | GT Power Generation | | | |
| 2 | Existing pressure drop across entire filter house in clean condition for GT/Compressor | mm of WC | | |
| | Final pressure drop limit for GT/Compressor | mm of WC | | |
| | Present life of filter elements | no of months | | |

| S.No | Operating conditions / Technical Parameters | UoM | Design Parameter | Remarks |
|-------------|--|------------|------------------|---------|
| | Present final grade of filtration | | | |
| 3 | Steam Condensate return temperature | Deg C | | |
| | Condensate flow | kg/hr | | |
| | Condensate return line header pressure | kg/cm2 (g) | | |
| 5 | Cooling water supply temperature | deg. C | | |
| 6 | Power supply conditions | | | |
| | Voltage with tolerance | V | | |
| | Frequency with tolerance | Hz | | |
| | Phase | | | |
| 6 | Instrument air pressure | kg/cm2 (g) | | |
| 7 | Cost of energy generation | | | |
